

**Subject:** Invalid ean codes in the Marvel API

Dear Marvel Developer Portal,

I am writing this report to inform about a possible data inconsistency found in the `/v1/public/comics/{comicId}` operation of the Marvel API. When searching for specific comics, the API seems to return invalid ean codes.

1. When providing the input ID "23648", the API returns as ean value the string "DEC082326", which is the DiamondCode of the comic.
2. When providing the input ID "6318", the API returns as ean value the string "9780785 127123 52499NA", which contains two letters at the end.

I would be grateful if you could confirm whether these behaviors are inconsistencies. The following video shows how to replicate this process.
